

Hi,

I am a new user of this package. I want to call GNOM from within RAW to do the $P(r)$ calculation. So I first installed RAW. It worked fine. And then I tried to install ATSAS package. I ran into a lot of issue here:

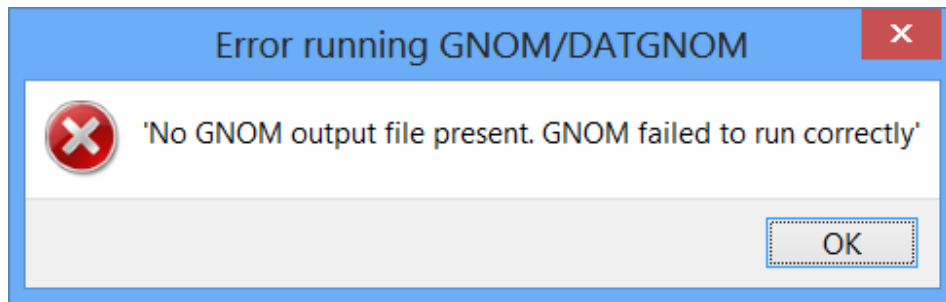

- 1) I am using Win 8 x64 system. I downloaded the latest 3.03-1 version. When I double click to install, the process stalled at around 30% of progress. I finally found that if I right click on the installer, choose "run as administrator", then I can finish the installation. So that was what I did.
- 2) Then, I add the installation path to the system PATH.
- 3) Then, I open the RAW program, click GNOM, then I got a lot of error message, please see the attached word document for the figure.

I have tried different version, different computers. I also have looked into other posts in this forum. Still I could not figure out a solution. Please help. Thank you very much!

After installation, when calling for GNOM from within RAW, this is what I got:

When I click "OK" on the small dialogue window, I got:

Then I click OK again, this small dialogue window disappear, but the rest error windows remain. I had to exit RAW.
